## Screendump from file.field.module

"cbm\_dev" is my function to test values. The results are shown below

```
861  foreach ($widgets as $key => &$widget) {  
862      // Save the uploading row for last.  
863  
864      // if ($widget['#file'] == FALSE) {  
865      cbm_dev('e', __FILE__, __METHOD__, __LINE__, '$widget[#file]', $widget['#file'], HR);  
866      cbm_dev('e', __FILE__, __METHOD__, __LINE__, '$widget[#file]==FALSE', $widget['#file'] == FALSE);  
867      cbm_dev('e', __FILE__, __METHOD__, __LINE__, 'empty($widget[#file])', empty($widget['#file']));  
868      if (empty($widget['#file'])) {  
869          cbm_dev('e20', __FILE__, __METHOD__, __LINE__, '$widget', $widget);  
870          $widget['#title'] = $element['#file_upload_title'];  
871          $widget['#description'] = $element['#file_upload_description'];  
872          continue;  
873      }  
874  }
```

## Scenario 1

From line 865-869:

1. \$widget contains i.a. [#entity]
2. \$widget[#file] exists, but is empty (FALSE)
3. The value for an existing \$widget[#file] that is empty is FALSE

```

## Scenario 2

From line 865-869:

1. \$widget doesn't contain [#entity]
2. \$widget[#file] doesn't exist and therefore gives a warning for line 866
3. The value for not existing \$widget[#file] is FALSE.

```
