amateescu .

Druplicon amateescu: 11 hours 46 min ago <berdir> tell amateescu Hey, can you have a look at <https://www.drupal.org/node/2430219> and post what's your thoughts on providing an upgrade path so that we can initialize the key value there? should we make some methods public, or are you just going to work directly with key value?

- **amateescu** looks

berdir amateescu: that :) thanks for the review on the field map issue

berdir amateescu: I also just did a re-test of search_api_solr on travis, now it fails on schema issues in search_api_solr..

amateescu berdir: I already committed two more patches there

amateescu berdir: build #100 that's running now should be good :)

berdir nice

amateescu https://github.com/amateescu/search_api_solr/commits/8.x-1.x

amateescu berdir: if you fix those two small point, I can rtbc the field map issue

amateescu *points

berdir amateescu: will do asap :)

amateescu berdir: told you: https://travis-ci.org/amateescu/search_api_solr :d

amateescu :D

berdir amateescu: that + the key value issue above should then allow us to handle sites with hundreds of bundles fairly well, will do more profiling once they are in

amateescu berdir: ah, that reminds me. do we need to run that test script again in the field map issue?

amateescu for the latest patch

berdir amateescu: yes, and no. my issue alone will not make it faster, because we don't call the field map during creation. the primary reason it is slow is the uuid lookup that the key value issue fixes

amateescu I see

amateescu so we don't need to

amateescu I'll post that in a comment

berdir amateescu: I think it's ok. I did it before and reported the results in the evaluate issue

amateescu cool :)

berdir amateescu: what might be useful is testing performance of deleting fields when you have hundreds of them. there's a related issue, and it is currently insanely slow because there we call the field map.

berdir amateescu: but we also have that other issue, and we can do continue there with that...

amateescu berdir: yup, I agree
jibranlafk has joined (~jibran@drupal.org/user/1198144/view)

amateescu berdir: so for the lookup issue, wouldn't it be enough to just load and re-save all configuration objects?

amateescu berdir: looks like onConfigSave(ConfigCrudEvent \$event) should take care of... oh wait

amateescu that's in QueryFactory

amateescu wtf :/
larowlan has left IRC (Quit: Leaving.)

amateescu berdir: I think it would be better for me to work directly with key value, there's no need to expose some protected methods just for this one-time use case

amateescu berdir: I can copy some code just fine :)

amateescu dawehner: hi :)

amateescu dawehner: do you want to fix the fails in <https://www.drupal.org/node/2428103#comment-9892213> so I can rtbc again?

Druplicon <https://www.drupal.org/node/2428103> => String formatter should link to its translation. [#2428103] => 35 comments, 8 IRC mentions

amateescu dawehner: or you want me to fix them and find someone else to review?

dawehner amateescu: uargs, there are quite some of them
Upchuk has joined (~Upchuk@iecopc33.vub.ac.be)

dawehner amateescu: currently on 2472323 so feel free to try it

amateescu dawehner: ok, will do after lunch :)

dawehner amateescu: so I think /delete should still tell you, that you remove also the corresponding translations

dawehner amateescu: so if you somehow get to that URL, maybe by clicking on the delete link on the edit form

amateescu dawehner: yes, that's something that CT should add to the delete form

dawehner amateescu: are you sure that this belongs into CT?

amateescu dawehner: so for delete, after talking to **plach**, we decided that we can remove the custom delete form offered by CT

dawehner amateescu: i mean entities are translatable without CT in place,

aren't they?

dawehner its just that there is no UI for doing so

amateescu hm..

plach ★ amateescu: dawehner: I still have the chat logs if you need them

amateescu heh, yes, that should help a bit, sadly I must've forgotten some things

dawehner well my thought was that in case /delete informs the user, the same information could be presented on the bulk forms

amateescu that sounds right to me

amateescu plach: that's what we didn't discuss last time, how should bulk operations work / look like :)

plach ★ amateescu: I'm about to start client work, can we do that later?

dawehner amateescu: we can discuss in the meantime

amateescu plach: sure

amateescu dawehner: yep

plach ★ I really didn't wrap my mind around that part yet

dawehner amateescu: so yeah I think if you display something else than the source language the delete action should IMHO also just remove that particular entity translation?

amateescu dawehner: that sounds right

plach ★ +1

amateescu dawehner: but what happens if you have three entities

plach ★ only that translation actually

amateescu dawehner: one is the source language and two translations

dawehner amateescu: all with the same NID?

amateescu dawehner: yep

dawehner mh tricky

amateescu dawehner: and you select the one with the source language and a translation

plach ★ IMO whenever you delete the source all the translations should go

plach ★ at least for now

dawehner well, ideally you could delete the source language and some other one takes over the role?

amateescu that would be a good first step I suppose

amateescu but we need to inform the user about this

dawehner right sure, we could do that now

plach ★ I agree that's the ideal solution

amateescu dawehner: I don't know if the system is prepared for that

plach ★ but replacing the original translation might be tricky at API level

amateescu yuo

amateescu yup

amateescu plach: I think I saw you comment that somewhere :)

plach ★ so IMO for now I'd just display a big warning that all translations are going to be deleted

plach ★ :)

amateescu big warning++

plach ★ if a source is selected

dawehner plach: amateescu do you think this should be part of CT or is it okay that we do that independent from it?

dawehner i mean we should have the information available without CT

plach ★ I'd be fine either way

amateescu I'm not really sure what CT is adding on top of the entity system right now, so I'll let **plach** answer that :)

plach ★ the entity system knows about translations

plach ★ so I guess it's ok for entity forms to know about them too

amateescu there we go :)

plach ★ but if that's deemed "too much knowledge" we can certainly make CT do that instead

plach ★ that's exactly the kind of things it does: building a UI around the core API

amateescu plach: who would be a good person to ask that? yched? gabor?

plach ★ I guess fago/berdir/yched

plach ★ I don't think Gabor would have strong opinions on that, but I might be wrong

amateescu lucky that two of them are here :)

plach ★ btw, if we go the big warning way, regardless of who displays it, we should have it on the single delete form

plach ★ too

amateescu sure, +1

plach ★ actually I thought CT already did that but I might be confused by D7

dawehner plach++

plach ★ I didn't do it ;)
