

**ventral***Let's dump some Drupal stuff on this jerky domain*[Home](#)

http://git.drupal.org/sandbox/tbenice/1690422.git

Keep in mind that this is primarily a high level check that does not replace but, after all, eases the review process. There is no guarantee that no other issues could show up in a more in-depth manual follow-up review. This service depends on modules that are still under development and changed frequently hence the quality of automated reviews can vary from day to day.

It appears you are working in the "master" branch in git. You should really be working in a version specific branch. The most direct documentation on this is [Moving from a master branch to a version branch](#). For additional resources please see the documentation about [release naming conventions](#) and [creating a branch in git](#).

Review of the master branch:

- [Drupal Code Sniffer](#) has found some issues with your code (please check the [Drupal coding standards](#)). See attachment.

This automated report was generated with [PAReview.sh](#), your friendly project application review script. You can also use the [online version](#) to check your project. You have to get a [review bonus](#) to get a review from me.
